

WHAT IS CLAIMED IS:

1. A construction sheet material comprising (a) a cellular expanded sheet of material formed by longitudinally stretching a sheet of flexible material having discontinuous slits in spaced apart parallel lines, and (b) a filler material comprising aggregate and tar filled in the cells of said cellular expanded sheet.

2. The construction sheet material of claim 1 wherein said flexible material is cardboard.

3. The construction sheet material of claim 1 wherein said flexible material is plastic.

4. The construction sheet material of claim 1 wherein said flexible material is metal foil.

5. The construction sheet material of claim 1 wherein said aggregate is sand.

6. A method of producing a construction material comprising the steps of slitting a sheet of flexible material to provide discontinuous slits in spaced apart lines parallel to each other, stretching said slitted sheet to produce a three-dimensional cellular configuration, filling the cells thereof with a mixture of melted tar and aggregate, and subsequently

cooling said material to produce a hardened layer of construction material.

7. The method of claim 6 wherein said flexible material is cardboard.

8. The method of claim 6 wherein said flexible material is plastic.

9. The method of claim 6 wherein said flexible material is metal foil.

10. The method of claim 6 wherein said aggregate is sand.

11. A method of providing a construction material comprising the steps of producing a compact roll of a continuous sheet of unexpanded flexible material having discontinuous slits in spaced apart lines parallel to each other; transporting said roll in compact, unexpanded form to a site of usage; unrolling and stretching said continuous sheet to provide a three-dimensional cellular material; and filling the cells of said cellular material with a mixture of melted tar and aggregate.
